

1.1 Motivation

Taking notes should be quick, spontaneous, and effortless like a fleeting note that capture your immediate thoughts or insights. Imagine yourself in a lecture where the presenter suddenly shares an idea that inspires you. You have three choices:

1. Attempt to store it in your memory and risk forgetting later, or
2. Quickly write it on a piece of paper, risking disorganization.

Both of which are not ideal. That's why we aim to build a chat-style app that enables you to start writing notes almost instantly, focusing on speed and a natural flow of text-based commands. This reduces the overhead that often comes with traditional note-taking tools and helps avoid the chaos of disorganized paper notes.

1.2 App Structure

- Minimal overhead: Minimal loading time and clicking before entering the app and start taking notes.
- Chat-Style Notes Interface: Each note appears as though it were a message in a chat for an conversational-like feel.
- Tagging & Reminders: Fast commands like adding `\tag:important` or `\reminder:tomorrow` to label the note and set reminders in seconds.
- Fast Searching: Easily search with a tag or a text to find what you want.
- Audio-Notes: Audio-Notes integration to make it easier to capture a conversation or a talk and search for it back.

1.3 Similar Apps

Below are two types of comparable applications:

1. Chat Applications (e.g., WhatsApp, Telegram)
 - a. Why It's Not Ideal:
 - i. Typically lacks robust reminders or note-specific features.
 - ii. Designed primarily for messaging, so note-taking integrations are often limited or absent.

2. Traditional Note Apps (e.g., Google Keep, Evernote, Apple Notes)

a. Why It's Not Ideal:

- i. Some have a multi-step process (e.g., selecting notebooks, choosing formatting, waiting for load times) before typing.
- ii. Overhead can slow down the process, interfering with the quick capture of “fleeting” ideas.

By seeing these apps, we see an opportunity to mix the quick, conversational feel of chat apps with the organizational capabilities of a note-taking tool—minus the overhead and complexity.

1.4 Disclaimer on Potential Changes

During development, certain design decisions may evolve. Our primary aim is to ensure a fast note-taking with a stable application. However, if we discover more efficient approaches or enhancements, we will adapt accordingly to maintain speed and usability.

1.5 Implementation – Overall Approach

1. Project Structure

- a. A modular approach: one core module for note/chat logic and user interaction, one for the UI, and one for data storage.

- b. Prioritize speed and simplicity: immediate text input should be possible as soon as the app is launched.
- 2. Database & Data Handling (Hive)
 - a. We have chosen Hive for our data solution due to:
 - b. Speed: Hive is known for its quick read/write operations.
 - c. Offline-First Capability: Data is stored locally, enabling the user to write and access notes without internet connectivity.
 - d. Simple Integration: Hive is straightforward to set up and integrate with Flutter making out live easier.
- 3. Agile Development Process
 - a. Use Git branch workflows (feature branches, pull requests) for team collaboration.
- 4. Continuous Feedback
 - a. Gather user feedback on performance, usability, and layout.

1.6 Plan of Action

- 1. Research & Setup (Stage One)
 - a. Conduct initial exploration into best practices for chat-style UIs.
 - b. Set up the Git repository.
- 2. Implementation (Stage Two)
 - a. Develop and integrate the chat-style UI, quick-reminder/tagging system, and Hive-based database layer.
 - b. Focus on performance optimizations to guarantee minimal load times.
- 3. Production Readiness (Possible Stage Three)
 - a. Conduct comprehensive testing: user acceptance tests, and performance benchmarks.
 - b. Polish the UI, finalize minimal or optional features.
 - c. If applicable, plan app store deployment and marketing campaign release strategy.
